

I'm a member of a Telegram group that has two different bots invited into it. Both bots can read, write, and delete messages in the group because they have admin privileges and privacy mode is turned off. But neither bot can see or manage the messages created by the other bot. Is this normal for Telegram? What options do I have to allow the bots to see each others' messages?

Yes — that is normal in Telegram. Telegram explicitly says bots with admin rights and privacy mode disabled still do not receive messages sent by other bots, and it gives bot-to-bot loops as the reason.^[1]

What you can do

- Use a human user account as the relay: have one bot respond to messages from a real user, then forward the result to the other bot through your own code or service.
- Add an external message bus: Redis, a database table, a webhook endpoint, or a queue can act as the shared coordination layer between the two bots.
- Use a shared control channel or group where a human account posts the trigger messages, since bots can see user messages when privacy mode is disabled or they are addressed directly.^[1]
- Redesign the workflow so each bot talks to your backend instead of directly to the other bot.

What will not work

- Giving both bots admin rights.
- Turning privacy mode off.
- Mentioning one bot from another bot in the group.

Those settings help bots see more user traffic, but they do not override Telegram's rule blocking bot-to-bot visibility.^[1]

Practical recommendation

For a clean setup, keep Telegram as the front end and let your own service coordinate the bots behind the scenes. That avoids Telegram's bot-to-bot restriction while still letting both bots act in the same group. ^[1]
